18.1 Overview

18.3 Passive Design Considerations

18.3.1 Access: Safe Movement and Connections

The University requires well-defined routes, spaces and entrances that provide for convenient and safe movement without compromising security. This must consider movement in both internal and external spaces, the likely modes and times of travel, and access and mobility.

Safe access is provided between key destinations and entrapment spots eliminated. Access shall be designed to maximise visibility and avoid creating potential hiding places. When potential entrapment spots cannot be designed out, they shall be gated or secured at night.

Spacial planning shall endeavour to avoid internal elements such as dead-end corridors or blind corners.

Multiple exit points are to be provided from public spaces and along pedestrian routes. These should be clearly signposted in advance of entrances to any movement
